## HOOF SOLUTIONS USA

### **Bovi-Mycin**

Bovi-Mycin is rapidly becoming known as the Breakthrough in Bovine Wound Treatments. Specifically for abscesses and lesions. Although this gel was developed for the individual treatment on mature dairy cattle, our customers throughout the U.S. are using it for sheep, goats, swine horses and even canine pets!

In 2015 it became known that Tetracycline and other antibiotics were going to become a script in December 2016 and strictly enforced by July 2017. Since the antibiotics get in the blood stream of the cattle through open and exposed wounds, random testing was going to be administered on site for antibiotics in the milk. There was a threshold percentage that was being \*\*looked for but even if there were traces of antibiotics the dairy would still be in violation. Big Fines!

Hoof Solutions immediately went to work knowing that there were no other effective products on the market which meant BIG problems for dairies throughout the U.S.. By Dec, 2016 Hoof Solutions was concluding their final stages of field testing on the 5 different formulas in 5 different states going through all 4 seasons. By Jan, 2017 we knew which formula was the clear choice with the final astonishing results. We now learned that we had a superior product and finalized preparation for full production.

The molecular structure of the hoof has been compromised, we know this so with that in mind, we knew where to begin our formula development. With environmental and health concerns for not only the animals but consumers and end users of dairy products, Bovi-Mycin is formulated with ecofriendly and healthy ingredients. We use only the highest grade organic oils, soothing natural liquids, anti-inflammatory organic powders, natural antioxidants, formulated anti bacteria gel, natural disinfectants and pain-reducing fine particle-beta hydroxy acid to ensure immediate comfort. This is all synthesized throughout a 10 stage temperature sensitive process that results in accelerated healing that stimulates rapid cell reproduction.

This is not just a treatment that will exterminate an evident problem, it provides a barrier against detrimental environmental influences and will reduce edema and create strength in the tissue and the peri wound to help prevent reoccurrence. Bovi-Mycin can also be spread on the rest of the hoof for fortification and strength. Applying it on the ankle is a good idea too if there are signs of swelling.

Bottom line.....Hoof Solutions has formulated results!
