

Bovi-Mycin® Powder

Bovi-Mycin® Powder is being used as an analgesic to relieve pain, a disinfectant for bacterial infections, as well as an antiseptic to help prevent reoccurrence. It's intended use is to replace topically administered Antibiotics that hoof trimmers use to treat Digital Dermatitis, Hoof Rot, and numerous fungal infections that occur on Bovine hoofs due to harmful bacteria caused by damaging microorganisms. When used correctly, most cases only need one application to see full positive results within a 24 to 48-hour period. Bovi-Mycin® Powder is blended with ingredients that target infections and extract toxins and moisture, while simultaneously absorbing vitamins and minerals into the wound to build hoof and tissue strength relieving cows of discomfort and alleviating future infections.

One of the most common and critical concerns of dairymen is if there are any traces of residue in milk testing. The answer is NO. No residues have been found in milk after treatment while using Bovi-Mycin® Powder or any Hoof Solutions™ products for that matter. Although, milk is not the only concern. The quality of fermented products such as creams, yogurt, and cheese can be impacted by residues of antibiotics as well as any other foodstuffs. Hoof Solutions™ product line does not affect any of these items.

Bovi-Mycin® Powder is not considered an organic product, though it is formulated with certified organic ingredients and does not consist of any "fillers". Each ingredient has a purpose to ensure that none of them get overpowered and the efficacy does not get compromised. Our 14-step process is unique and extensive, therefore quality control is extremely important to the process. There are disinfectants as well as essential oils that we put through our own proprietary process in order to achieve a powder form prior to the final blending for the finished product. This is done with the purpose that the cow hoof will benefit from the effects of essential oils that are known as powerful healing ingredients but will not allow the wound to maintain any moisture that welcomes back harmful bacteria.

Cow lameness is an important part of overall cow health in dairy farms globally. Poor hoof care and dairy conditions leads to infections that keep cows from eating and exercising which in turn greatly decreases milk production. This is very costly for our dairy farmers worldwide.

By using Hoof Solutions™ products, dairy cows will feel comfortable and return to expected feed and milking routines right away.

Bovi-Mycin® Powder is being considered as the ultimate replacement of powdered antibiotics used for hoof treatments that are highly regulated due to milk and beef contamination.

Bovi-Mycin® Powder is Antibiotic free, NO Script, NO residue. It is affordable and persistently being considered the most affective Hoof Care product currently on the market today.
